SIMPLIFIED INSTRUCTIONS WITH DRAWINGS
HOW SAFE COMBINATIONS ARE OPENED WITH THE DIAL
WITHOUT DRILLS OR TOOLS OF ANY KIND

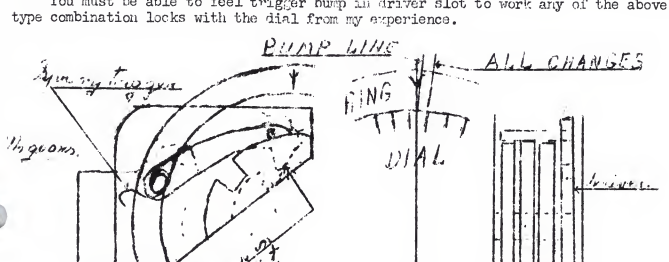
I don't guarantee you to learn to open safe combinations and there will be no refund. When you get the idea, no one could take it away from you.

Combination locks with spring trigger and without gears work very good, it is my opinion most of this type combination locks can be worked with the dial unless locks were designed to keep method from working.

You must be able to feel trigger bump in driver slot to work any of the above type combination locks with the dial from my experience.



In my opinion the reason safe combinations can be worked with the dial, the outside edge of tumblers are not concentric with center of tumblers, this means there are high and low places on the rim of most tumblers. If a straight edge were placed across a nest of tumblers or trigger bar was let down on a nest of tumblers free of driver, a tumbler might be turned part of a turn with the finger without touching bar.

If tumblers were perfect and tumbler tube post was out of a square or trigger was imperfect or not lined perfect across tumblers, a person may be able to get the right numbers by working dial as described.

The first thing to learn is to feel trigger bump against one side of driver slot when dial is turned left or right free of change tumblers.

On most all safe combination locks with spring trigger and without gears, trigger bar is held off change tumblers by driver except when trigger springs into driver slot.

After you get the feel of trigger bump, the next thing to do is to try to stop dial at bump without raising trigger bar off change tumblers, take back off combination lock to see what you are doing.

You must learn to stop dial on trigger bump without raising trigger bar off change tumblers, after you master this, look at nearest line on dial to line to line on dial ring; learn to judge the distance between line on dial ring and nearest line on dial when dial is turned to bump on one side of driver slot without any change tumbler slots being lined up with trigger bar. The distance between line on dial ring and nearest numbered line on dial is where all changes are to be
